
97 Chevy K1500 CSFI fuel system low pressure

Posted by pilona42 - 2010/02/26 21:20

So I have been pulling my hair out for over a week! I think I have a low fuel pressure problem. I replaced my fuel pump, filter, and fuel pressure regulator. With the engine running at idle the fuel pressure is at 55lbs. When I just cycle the key the pump runs at 64lbs. What could my problem be? The only thing left to replace is the spider but im trying to avoid that. Also I have a TPS error code that keeps coming up. Can this be related?
